

centers

observation map: every coupling, every seed, underlying main Fig. 4b

24-bin phase histogram, bin centres in standard notation · $N = 17$ oscillators, 100 steps · 26 Claude cells

r_1 r_2 r_3 $r_m = |\langle e^{im\theta} \rangle|$

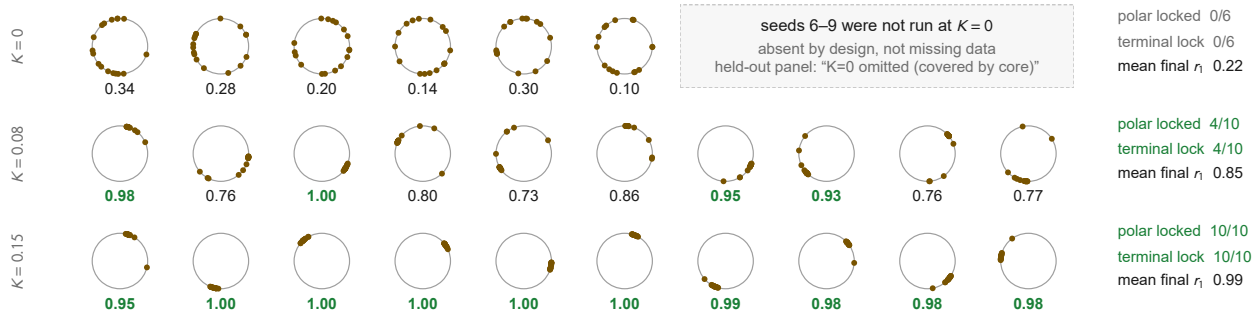

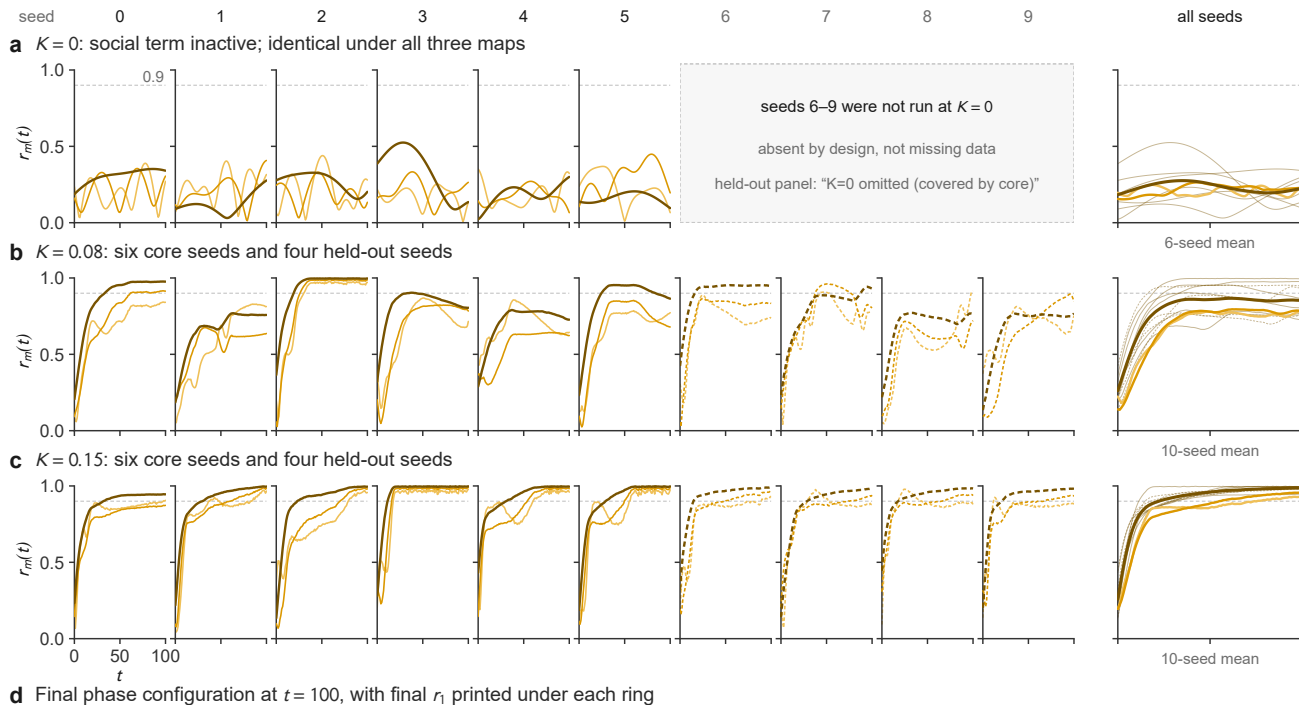

core seed

held-out seed

seed mean

core · 6 GPT-shared seeds

held-out · 4 new seeds

At $K = 0$ the social term is inactive, so all three observation maps drive identical trajectories (engine-matching control, $\max |\Delta r_m| = 0$).
