

A Polar-lock threshold sweep

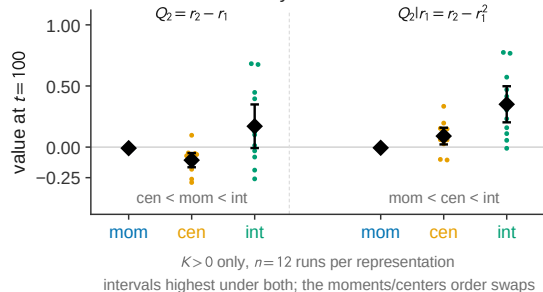

B Sustained-window sweep

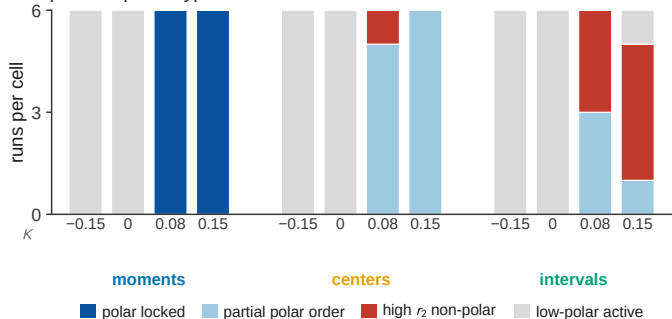

C Transient or permanent crossing

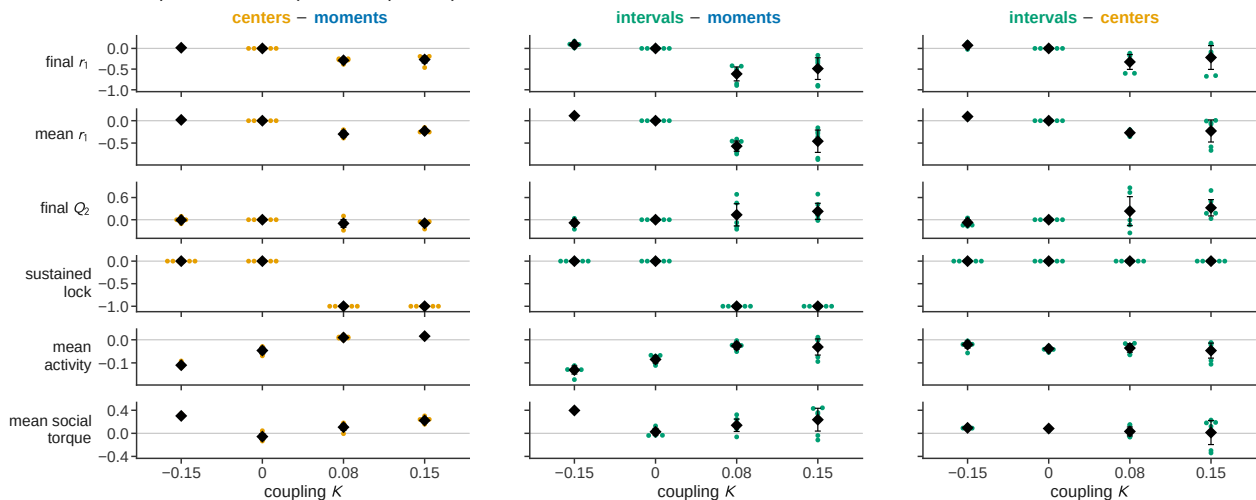

D Harmonic-relative summary definition

E Prespecified phenotype counts

F All seed-level endpoint contrasts (six seeds per cell)

At the prespecified setting (final $r_1 > 0.9$, $W=1$) the re-classification reproduces the stored phenotype table cell for cell: moments 12/12 locked at positive K , centers 0/12, intervals 0/12; exact paired sign $p=0.03125$ per positive K (6 paired seeds).
