

## G Fieldwise pairwise total variation, all 48 fields $\times$ 3 variant pairs

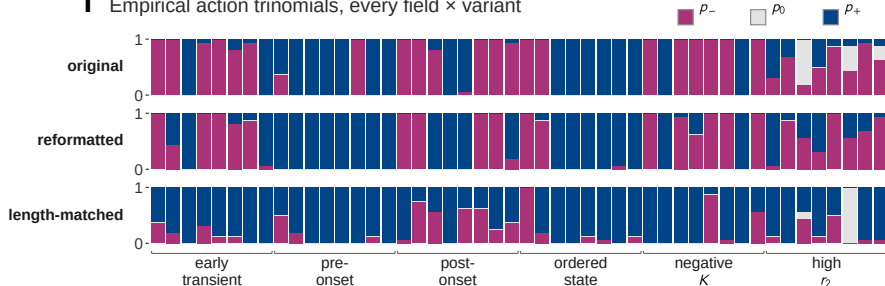

original-reformatted: median 0.0000, mean 0.1445, 27/48 exactly zero; original-padded: median 0.3750, mean 0.4141, 13/48 exactly zero; reformatted-padded: median 0.2188, mean 0.3737, 12/48 exactly zero. Fields are ordered by replay stratum (8 per stratum), not by field index; the same order is used in i.

## H Within-variant block noise

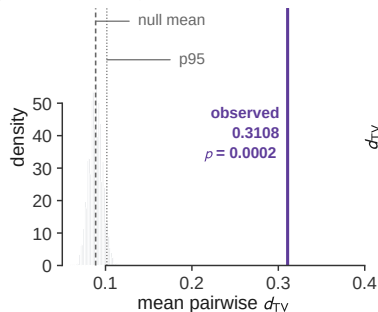

Block 1 vs block 2 within one variant, per field: the noise floor the pairwise distances in  $g$  must beat. Pooled mean 0.0686 (dashed).

## I Empirical action trinomials, every field $\times$ variant

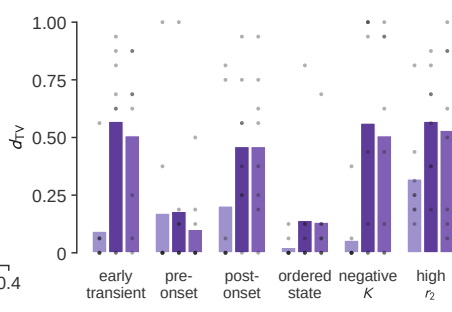

Each bar is one field: the 16 responses split into retard / stay / advance. Rows are the three variants; the same 48 fields in the same order as g.

## J Variant-label permutation null

All 5,000 field-blocked permutations of the variant label are plotted.

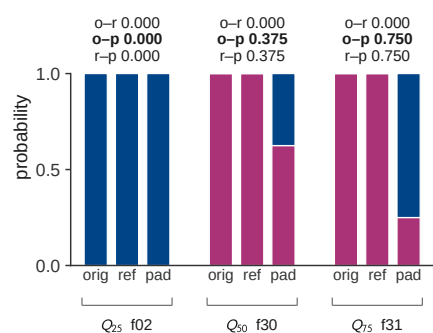

## K Effect by replay stratum

original-reformatted  
original-padded  
reformatted-padded

Bars are stratum means over the 8 fields of that stratum; dots are those 8 fields. Every stratum shows the padded condition separating.

## L Quantile-selected examples

Fields nearest the 25th, 50th and 75th percentile of the original-padded contrast (ties broken by field index). o-r, o-p and r-p are that field's own distances for the three variant pairs.
