

### A 3×3 replay design

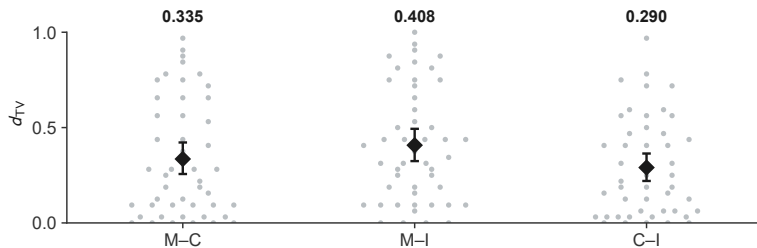

### B Activity $A_{S, R}$

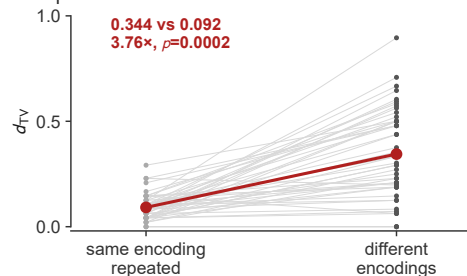

### C Signed action $a_{0, S, R}$

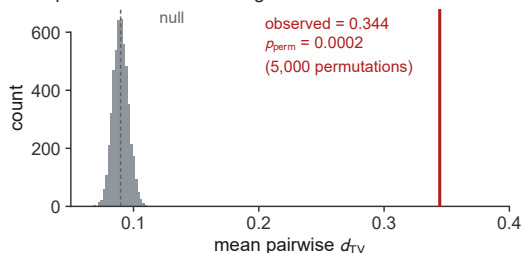

### D Pairwise presented $d_{TV}$ (48 fields)

### E Separation versus test-retest noise

### F Separation when encoding labels do not matter

### G Questions tested

| Question                                                         | $p$    | Verdict ( $\alpha = 0.05$ ) |
|------------------------------------------------------------------|--------|-----------------------------|
| Does re-encoding change the response to the same field?          | 0.0002 | Supported                   |
| Do fields generated under different encodings differ on average? | 0.078  | Not conclusive              |
| Does that effect depend on which encoding generated the field?   | 0.072  | Not conclusive              |

Strong presented-encoding effect at a fixed field.  
No conclusive evidence either way for source-dependent modulation.
